

Protein serves as a source of amino acids. The body needs amino acids to build the various proteins used in the growth, repair and maintenance of body tissues such as skin, bones and muscles.

Why Casein?

Casein is a slow digesting protein derived from milk. When compared to other sources of protein such as soy and whey, casein increases blood amino acids at a much slower and steadier rate. This delayed digestion and absorption of amino acids may be beneficial between meals or in the evening to provide a steadier supply of muscle fuel, crucial to maintaining an anti-catabolic state and significantly decrease protein breakdown.

This chart compares the branched chain amino acid (BCAA) absorption after consuming casein and whey protein. When compared to whey, casein concentration was significantly lower after one hour, forty minutes, but increased after five hours.
