How Melatonin Works

Melatonin is naturally produced in the pineal gland of the brain. Production is triggered when the sun goes down, signaling the body to prepare for sleep.

Melatonin plays a key role in the body's circadian rhythm—the “Sleep-Wake” cycle—by helping to establish normal sleep patterns and promote a more restful, relaxing sleep.†

Getting Good Sleep

In addition to helping you wake up feeling refreshed and energized, getting good sleep has a range of long-term benefits. Getting better sleep can contribute to a healthier life overall with everything from sharper brain functioning to more balanced weight.†

Melatonin is a Nighttime Sleep Aid for Occasional Sleeplessness†
