MK 677 (Ibutamoren) – is a non-peptidic, orally active and selective agonist of the **growth** (<https://www.mz-store.com/hgh-stimulators/blackstone-labs-growth-90-caps>) hormone secretagogue receptor. MK 677 mimics the action of ghrelin in the stomach. As a result this raises **growth** (<https://www.mz-store.com/hgh-stimulators/blackstone-labs-growth-90-caps>) hormone and IGF-1 levels, but does not affect cortisol levels. Human studies have shown it to increase both **muscle mass** (<https://www.mz-store.com/gainers-10-19-of-protein/biotech-muscle-mass-1000g>) and bone mineral density. At 25 mg daily, Ibutamoren has been shown, in humans, to increase IGF-1 levels 60% in 6 weeks. A 72% increase in IGF-1 levels was seen after 12 months. MK 677 is non-hormonal, and therefore requires no PCT after cycle is over. MK 677 can best be utilized in at least a 3 month cycle with dosage increasing each month. The optimal dosing time for MK 677 is at night directly before going to bed. One should start noticing deeper sleep almost immediately. If one should wake up with numb or tingling hands, do not worry. This is a common side effect of the extra GH in the system.

DOSAGE

In order to achieve optimal results, take 10-20 mg of MK-677 a day.
