

Arginine is an amino acid produced in the human body by the digestion or hydrolysis of proteins. Arginine can also be produced synthetically. Because it is produced in the body, it is referred to as "nonessential."[†]

Because arginine is naturally converted into nitric oxide by the human body, researchers have conducted preliminary studies to determine the effectiveness in using it as a supplement for supporting cardiovascular health. Other studies indicate that arginine promotes immune health and liver support. Athletes supplement with arginine for its benefits in maintaining lean muscle mass while performing strenuous exercise.[†]
