

Directions: As a dietary supplement, adults take one (1) softgel daily, or as directed by a health care professional.

The role of Vitamin D in helping to maintain bone density and strength is clear. It is required for the process of moving calcium through the intestinal wall into the bloodstream. Even though the human body can manufacture Vitamin D under ideal circumstances, there is strong evidence that much of the American population suffers from a deficiency of the nutrient. This means that supplementation may be important. Cholecalciferol (D3) is a natural, highly bioavailable form of Vitamin D derived from lanolin.[†]
