II About Healthy Joints

Your joints are natural mechanical marvels, but like all things with moving parts, wear and tear can take a foll. Yaars of repetitive motion can affect the slick, protective cartilage that acts as a "shock absorber" covering the ends of bones. When this happens, mobility and comfort may be compromised.

/hat is Cartilage?

Cartilage is made of a mesh of collagen and a gel of proteoglycans.

The cells that help break down and dispose of old cartilage and replace it with new materials are called chondrocytes.

What Roles do Glucosamine and Chondroitin Play?

Both Glucosamine and Chondroitin are components of cartilage

In healthy younger individuals, these materials are readily available for rebuilding cartilage. But as we age, demand may exceed supply. What's more, there are no practical food sources of either Glucosamine or Chondroitin, other than supplements.
