### Collagen, a protein essential for our body

Collagen is an essential protein produced in large quantities by our body, essential for the elasticity and regeneration of tissues. Collagen is present in the composition of bones, skin, ligaments, cartilage and tendons, but with age, this natural protein breaks down and loses its effectiveness, causing a decrease in bone density, pain in blood vessels and the appearance of wrinkles. Due to this, daily consumption of this protein is necessary because the body can no longer produce it by itself.
