

All joints are comprised of two main components: collagen and proteoglycans. Decreased joint space as we age is known to be caused by a loss of proteoglycans and can be pronounced in those with injuries, excess body weight, and poor diet. Chondroitin is a key component of proteoglycans, and glucosamine is the primary building block for all joint components. With age, cartilage can begin to deteriorate as its regeneration rate decreases. **Glucosamine-Chondroitin** can reduce pain with joint protective effects, with popular clinical experience and benefits.†
