\*\*Adequate calcium as part of a healthful diet, along with physical activity, may reduce the risk of osteoporosis in later life.

Bone health can be dependent on many factors including heredity, diet, exercise and lifestyle. Calcium is the primary mineral responsible for strong bones.\* The body also uses Calcium for proper muscle contraction and nerve function—and obtains this Calcium from the bones or dietary intake.\* Because the body cannot produce Calcium, a balanced diet, regular exercise, healthy lifestyle choices and adequate intake of Calcium and Vitamin D can play a role in maintaining optimal bone health.\* Calcium and Magnesium play essential roles in maintaining proper bone mineralization.\* Calcium and Magnesium are also involved in muscle contractions and nerve impulses.\*
