

Adequate vitamin D3 is required to facilitate digestion of calcium from foods. It is also the natural, starting biochemical for the synthesis of calcitriol. Proper bloodstream levels of calcitriol are absolutely critical for signaling bone-forming calcium deposition by osteoblasts and for maintaining proper calcium levels in muscles and nerves. Vitamin D inadequacy is now thought partially responsible for some forms of osteopathy, myopathy, immune weaknesses and several types of inflammatory conditions. Many North Americans suffer from vitamin D deficiency which can be exacerbated during winter. Circulating D3 levels should be maintained through supplementation.[†]
