

Ubiquinol is the active, antioxidant form of CoQ10 (ubiquinone). Ubiquinol is an essential nutrient for cellular energy function, but age and other factors affect our body's ability to produce CoQ10 and convert it to ubiquinol.[†] This antioxidant has many benefits including promotion of cardiovascular health, a key component in the body's energy production, and one of the most powerful lipid-soluble antioxidants.[†] **Ubiquinol Prime** has consistently been shown to be more absorbable by the body than conventional CoQ10.[†]
