

Glutamine peptides are suitable for individuals with digestive system conditions such as stomach ulcers, ulcerative colitis, and Crohn's disease. Studies have shown that glutamine can strengthen your immune system and reduce your risk of infection after surgery. Glutamine supplementation is also given to critically ill patients as clinical nutrition.

Supplementing with glutamine may help maintain muscle mass, strengthen the digestive and immune system, and improve recovery time from exercising. Glutamine peptides have been shown to be absorbed faster, and are more bio-available than standard L-glutamine powder. Peptide-bound glutamine is a scientific process that binds L-glutamine to peptides, making it stable and doubling its absorption rate.
